

EscapeBook

Project Summary

This project is a web application for managing and booking escape room sessions. It allows users to explore available rooms, check their details, view available time slots on a calendar, and make online reservations easily.

Problem Statement

Many escape room venues still rely on manual booking systems or outdated websites that make it difficult for users to check room availability and schedule reservations efficiently.

Target Users

- People who enjoy escape room experiences and want a quick, easy way to book sessions online
- Escape room business owners who want a simple, centralized booking management tool

Proposed Solution

A responsive web application that:

- Displays available escape rooms with descriptions, difficulty levels, and images
- Integrates a calendar for selecting time slots and checking availability
- Enables users to make reservations directly through the platform
- Allows administrators to manage rooms, bookings, and schedules

How We Came Up With the Idea

We got the idea because our friend runs an escape room, and we noticed that the booking process could be improved with a modern and user-friendly online system.
